

Flexiguard Optiflex System

The Flexiguard Optiflex system is based on the highly successful Flexiguard Sensor cable processing engine but uses an optical fibre front end and an optical fibre sensor cable.

All the usual features of the Flexiguard range are retained such as individual digital controls for sensitivity, gain, time window and impulse count together with a full set of diagnostic ultra bright LED's for system setup and testing.

The Optiflex analyser can be interfaced with any alarm panel or PLC system. It can also be controlled using our Megasys PC system, which gives full graphical display of every zone.

The optical fibre sensor cable uses 62.5/125 fibre housed in an ultraviolet resistant outer sheath. The system uses industry standard ST connectors for quick and easy termination of the optical fibre.
